

# SOLVING AN OPTIMAL BUSINESS LOCATION PROBLEM

MIGUEL ÁNGEL BARBERÁN

In this project we will be determining the optimal location of a business in a city area by:

The data that was used contained information about the nationalities of the inhabitants of each neighborhood and the quantity of people by neighborhood:

Country of P	Total	Ciudad Centro	Arganzuela	Retiro	Salamanca	Chamartin	Tetuán
Rumanía	450360	8150	7540	4800	7530	6800	14680
China	372260	15000	13560	5640	7550	6520	10000
Ecuador	239530	6470	7410	2650	6190	3800	13950
Venezuela	233580	15500	9130	6000	15640	9800	13100
Colombia	226180	9980	7170	4830	8030	5510	8220
Marruecos	219090	11000	3900	1040	3220	2000	10000
Italia	203080	30300	12190	8400	18170	10600	11940
Perú	188290	5600	5200	2500	6120	4100	9650
Paraguay	186820	3640	4740	2370	5210	6570	33110
República De	175110	3650	6540	2090	3440	3020	22720
Honduras	159810	1490	2280	2320	3320	3370	7550

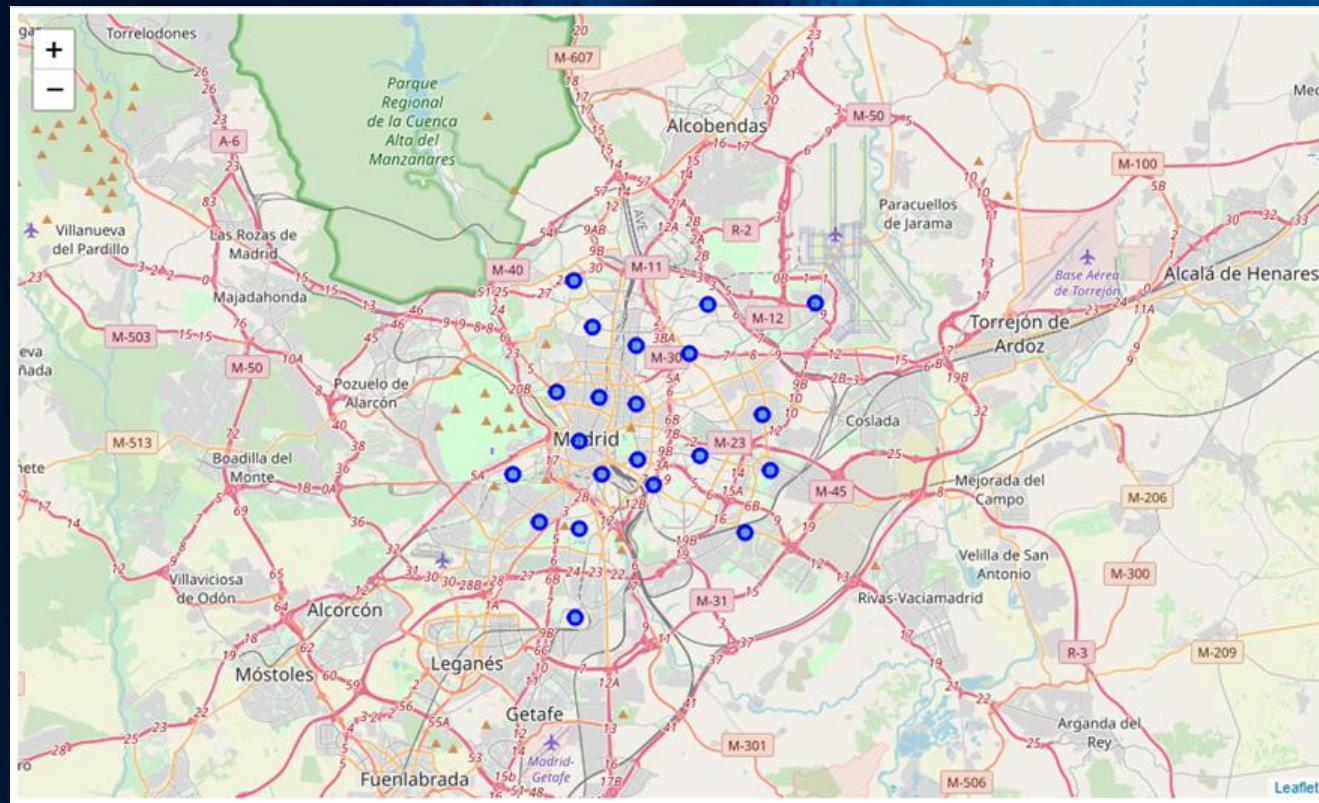

In order to access the Foursquare API data, the raw data had to be transformed this into something useful for the API:

- A second dataframe was created
- The neighborhoods's names were included
- The latitude and longitude values of each neighborhood were added

Neighborhood	Latitude	Longitude
Centro	40415347	-3707371
Arganzuela	40402723	-3695403
Retiro	40408072	-3676729
Salamanca	40413	-3677773
Chamartin	40453333	-36775
Tetuán	40400703	-37
Chamberí	40432792	-3697186
Puente de V.	40473311	-3709722
Moncloa-Ara	40435151	-3718765
Latina	40402401	-3741264
Carabanchel	40383669	-3727989
Uxama	40381233	-3708153
Puente de V.	40398204	-3669059
Monistalaz	40403333	-3644433
Ciudad Linea	4045	-365

Once the data was obtained, it was possible to draw the neighborhoods on a map:

Then, the nearby venues by neighborhood were extracted along with their frequencies of occurrence:

## VENUES BY NEIGHBORHOOD

Neighborhood	Neighborhood	Neighborhood	Venue	Venue Latitude	Venue Longitude	Venue Category
Centro	40415347	-3707371	Plaza Mayor	4,0415E+16	-3,7076E+16	Plaza
Centro	40415347	-3707371	Merced de	4,0415E+16	-3,7076E+16	Market
Centro	40415347	-3707371	La Taberna d	4,0415E+16	-3,7081E+15	Other Nightl
Centro	40415347	-3707371	The Har Mar	4,0414E+16	-3,7070E+16	Hotel
Centro	40415347	-3707371	Amorino	4,0416E+15	-3,7084E+16	Ice Cream Sh
Centro	40415347	-3707371	Bar Án	4,0414E+15	-3,7080E+15	Spanish Rest
Centro	40415347	-3707371	Bar El Cogoll	4,0414E+15	-3,7067E+15	Spanish Rest
Centro	40415347	-3707371	Chocolatería	4,0414E+15	-3,7068E+15	Chocolatería
Centro	40415347	-3707371	Pinkleton &	4,0415E+15	-3,7091E+16	Wine Bar

## VENUES'S FRECUENCIES OF OCCURRANCE:

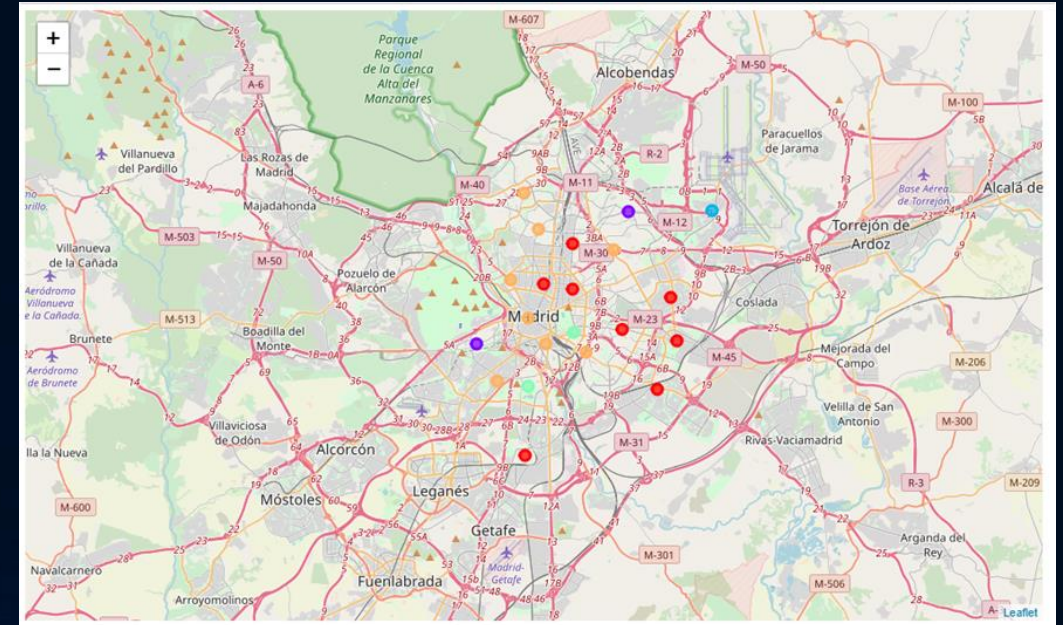

- ----Arganzuela----
- venue freq
- 0 Restaurant 0.10
- 1 Spanish Restaurant 0.09
- 2 Tapas Restaurant 0.05
- 3 Bakery 0.05
- 4 Grocery Store 0.05

Finally, a dataframe containing the most common venues by neighborhood was created:

Neighborhood	1st Most Common Venue	2nd Most Common Venue	3rd Most Common Venue
Arganzuela	Restaurant	Spanish Restaurant	Bakery
Barajas	Hotel	Spanish Restaurant	Restaurant
Carabanchel	Burger Joint	Fast Food Restaurant	Pizza Place
Centro	Spanish Restaurant	Tapas Restaurant	Plaza
Chamartin	Spanish Restaurant	Restaurant	Pizza Place

After obtaining these data, clusters could be made:

This is a sample of what our final clusters looked like:

Barajas	Neighbor	Cluster Labels	1st Most Common Venue	2nd Most Common Venue
3140	Centro		0 Spanish Restaurant	Tapas Restaurant
740	Villa de Valle		0 Food	Spanish Restaurant
1910	Retiro		0 Spanish Restaurant	Supermarket
3370	Ciudad Linea		0 Spanish Restaurant	Burger Joint
570	Vicálvaro		0 Spanish Restaurant	Breakfast Spot
2580	Chamartin		0 Spanish Restaurant	Restaurant
920	Usara		0 Seafood Restaurant	Bubble Tea Shop
610	Tetuán		0 Spanish Restaurant	Brazilian Restaurant

# Conclusions

- As far as we can see with this data, there are no Mexican populations registered in Madrid. However, in Cluster 1, it is possible to notice that there's a Mexican restaurant located in the "Centro" neighborhood, which is the town center.
- If a deeper exam is performed into this cluster, it is noticeable that its living population are mostly Latinos, mixed with some other Europeans, but mainly, the people living in this cluster come from south American countries. Apart of this fact, other kinds of Latin restaurants can be found, like Argentinian restaurants, tapas restaurants, and Italian restaurants. So, it is possible to tell that the inhabitants of this area like these kinds of food.
- By following this logic, if we would like to open a new Mexican restaurant in the city or any kind of restaurant in fact, it would only be necessary to find a where are the restaurants similar the one we want to open, study the population in that area, and find similar clusters of population in the city that don't have yet or have very few restaurants like the one we would like to open.
- In this example, clusters 4 and 5 could make a good match for our target population. Looking at the venues in these clusters, it is possible to find one Mexican restaurant, and a good bunch of fast food, Argentinian, and south American restaurants. So, in these clusters, it is possible to state that the existing restaurants matches the population's nationalities and tastes.
- In conclusion and taking into consideration the explanations given above as well as the data, it is highly possible that clusters 4 and five could be a good place to open our Mexican restaurants. As explained above, the same logic could apply to open other kind of restaurant or business in any other area of the city. It is only necessary to examine the existing businesses in our target area, and study the population, then compare these two factors with the same ones in areas where there are existing businesses like the one we want to open, and then verify if the matching is correct.
